

Boom Lift Attachments

Boom Lifts are a table lift piece of equipment that can be lifted or lowered to differing heights, making this apparatus a useful tool for certain industrial uses. There are some unique kinds of Boom Lift consisting of knuckle booms, scissor lifts, and aerial hoists, each operating in a different way.

Aerial lifts are most frequently used to transport people at ski lodges who are not comfortable with a snowboard lift. These lifts operate much like an elevator, snowboarders can be slowly but surely moved up the mountain, stopping at stations along the way until they contact the top. Aerial hoists are also utilized in construction, transporting people securely up and down the sides of multi-level construction sites.

Scissor lifts are quite regularly utilized by service businesses as the perfect way to securely enable personnel to repair and work on cables and wires attached to poles. Telephone, cable and power corporations have relied on the efficiency of this kind of boom jack for years.

The knuckle boom lift is created for use within areas of uneven ground and where the need to change direction could be required. This style of boom jack has the ability to fit in tight spots where a scissor lift cannot fit. Working between numerous machines in a production facility or in near proximity between two walls, the knuckle boom additionally features a standard table fitted with rails for security and employee safety.

The variety of boom jack required by organizations will sometimes depend on the nature of the job needed. Luckily, there are suitable designs for just about any duty.
