

Information on Drum Grippers

The drum gripper attachment is generally seen where applications are drum based. The attachment allows one to move the drums much more effectively and efficiently. A drum based attachment also allows the operator to rotate the drums into the right position. Depending on the size of the drums being lifted, many attachments will allow the user to simultaneously lift multiple drums. There are 2 types of drum grippers:

A) Steel Drum Gripper - Allows one to grasp the body of the drum

B) Bean Drum Gripper - Attaches to the rim of the drum
